Problem5

Description: Develop and Evaluate a machine learning model for 3D skeleton-based action recognition using UTD MHAD dataset.

Train/Test Split Criteria: Odd subjects (S1, S3, S5, S7) for Training and the rest (S2, S4, S6, S8) for testing.

Feature: Euclidean distance Distance feature (distance between corresponding joints from consecutive frames as shown in the below Fig.)

Handling Variable-length Strategy: Team has to decide.
